lag question

1. Final Variable:

- Once a variable is declared `final`, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

2. Final Method:

- A method declared `final` cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display() {  
    System.out.println("This is a final method.");  
}
```

3. Final Class:

- A class declared as `final` cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.

```
public final class Vehicle {  
    // class code  
}
```

Given a Java Program that contains the bug in it, your task is to clear the bug to the output. you should delete any piece of code.

For example:

Test	Result
1	The maximum speed is: 120 km/h This is a subclass of FinalExample.

```

1 class FinalExample {
2
3     // Final variable
4     final int maxSpeed = 120;
5
6     // Final method
7     public void displayMaxSpeed() {
8         System.out.println ("The maximum speed is: " + maxSpeed);
9     }
10 }
11
12 class SubClass extends FinalExample {
13
14     public void displayMaxSpeed() {
15         System.out.println("Cannot override a final method");
16     }
17
18     // You can create new methods here
19     public final void showDetails() {
20         System.out.println("This is a subclass of FinalExample.");
21     }
22 }
23
24 class prog {
25     public static void main(String[] args) {
26         FinalExample obj = new FinalExample();
27         obj.displayMaxSpeed();
28
29         SubClass subObj = new SubClass();
30         subObj.showDetails();
31     }
32 }
33

```

	Test	Expected	Got
✓	1	The maximum speed is: 120 km/h This is a subclass of FinalExample.	The maximum speed is: 120 km/h This is a subclass of FinalExample.

Passed all tests! ✓

Question **2**

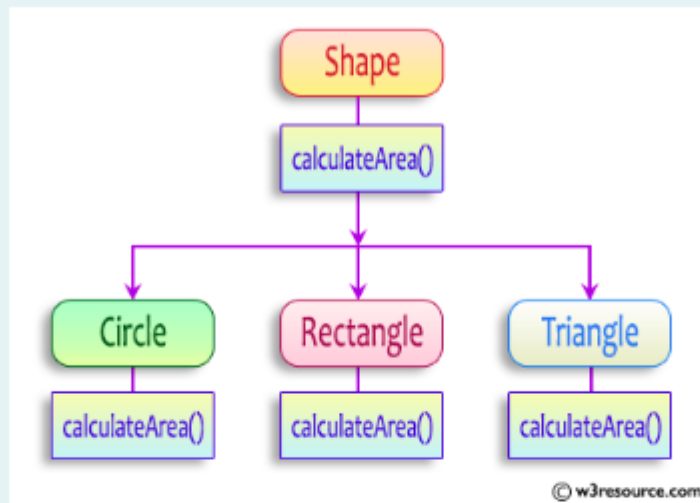

Correct

Marked out of 5.00

Flag question

Create a base class Shape with a method called calculateArea(). Create three subclasses shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation

```

abstract class Shape {
    public abstract double calculateArea() ;
}
  
```

System.out.printf("Area of a Triangle :%.2f\n",((0.5)\*base\*height)); // use this statement

sample Input :

```

4 // radius of the circle to calculate area PI*r*r
5 // length of the rectangle
6 // breadth of the rectangle to calculate the area of a rectangle
4 // base of the triangle
3 // height of the triangle
  
```

**OUTPUT:**

```

Area of a circle :50.27
Area of a Rectangle :30.00
Area of a Triangle :6.00
  
```

**For example:**

Test	Input	Result
1	4	Area of a circle: 50.27
	5	Area of a Rectangle: 30.00
	6	Area of a Triangle: 6.00
	4	

```

1 import java.util.Scanner;
2
3 abstract class Shape {
4     public abstract double calculateArea(double x, double y);
5 }
6
7 class Circle extends Shape {
8     public double calculateArea(double radius, double unused) {
9         return Math.PI * radius * radius;
10    }
11 }
12
13 class Rectangle extends Shape {
14     public double calculateArea(double length, double breadth) {
15         return length * breadth;
16    }
17 }
18
19 class Triangle extends Shape {
20     public double calculateArea(double base, double height) {
21         return 0.5 * base * height;
22    }
23 }
24
25 public class Main {
26     public static void main(String[] args) {
27         Scanner sc = new Scanner(System.in);
28         double radius = sc.nextDouble();
29         double length = sc.nextDouble();
30         double breadth = sc.nextDouble();
31         double base = sc.nextDouble();
32         double height = sc.nextDouble();
33
34         Circle circle = new Circle();
35         Rectangle rectangle = new Rectangle();
36         Triangle triangle = new Triangle();
37         System.out.printf("Area of a circle: %.2f\n", circle.calculateArea(radius, 0));
38         System.out.printf("Area of a Rectangle: %.2f\n", rectangle.calculateArea(length, breadth));
39         System.out.printf("Area of a Triangle: %.2f\n", triangle.calculateArea(base, height));
40
41         sc.close();
42     }
43 }
44

```

	Test	Input	Expected	Got	
✓	1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	✓

out of

question

As a logic building learner you are given the task to extract the string which has vowel as the first and last character.

Step1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings

Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found

input1: an integer representing the number of elements in the array.

input2: String array.

Example 1:

input1: 3

input2: {"oreo", "sirish", "apple"}

output: oreoapple

Example 2:

input1: 2

input2: {"Mango", "banana"}

output: no matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no matches found.

Example 3:

input1: 3

input2: {"Ate", "Ace", "Girl"}

output: ateace

**For example:**

Input	Result
3 oreo sirish apple	oreoapple
2 Mango banana	no matches found
3 Ate Ace Girl	ateace

```

1 import java.util.Scanner;
2
3 public class VowelStringExtractor {
4
5     public static void main(String[] args) {
6         Scanner scanner = new Scanner(System.in);
7
8         int n = scanner.nextInt();
9         scanner.nextLine();
10
11         String[] strings = scanner.nextLine().split(" ");
12
13         String result = VowelStrings(strings);
14         System.out.println(result);
15     }
16
17     public static String VowelStrings(String[] strings) {
18         StringBuilder concatenated = new StringBuilder();
19
20         for (String str : strings) {
21             if (str.length() > 0) {
22                 char f = Character.toLowerCase(str.charAt(0));
23                 char l = Character.toLowerCase(str.charAt(str.length() - 1));
24
25                 if (isVowel(f) && isVowel(l)) {
26                     concatenated.append(str);
27                 }
28             }
29         }
30
31         if (concatenated.length() > 0) {
32             return concatenated.toString().toLowerCase();
33         } else {
34             return "no matches found";
35         }
36     }
37
38     public static boolean isVowel(char ch) {
39         return "aeiou".indexOf(ch) != -1;
40     }
41 }
42

```

	Input	Expected	Got	
✓	3 oreo sirish apple	oreoapple	oreoapple	✓
✓	2 Mango banana	no matches found	no matches found	✓
✓	3 Ate Ace Girl	ateace	ateace	✓
